

Resume/CV

Devin Austin

devin.austin@gmail.com

970-290-6669

Summary:

I've been doing this for 15~ years. I love crafting code, solving problems and being challenged.

Writing code is a passion of mine and I really don't like leaving problems unsolved.

I'm a firm believer that if you hit your head against the wall long enough, you'll get through it.

Skills

Languages

- Java
- Scala
- Python

Applications/Technologies

Realm	Technologies
AWS	S3, RDS/Aurora, IAM, SSM, EC2, KMS secrets, Cloudformation, Glue, Athena, DynamoDB, Batch, EventBridge, Fargate, SQS, ECR, ECS
SQL	Postgres, MySQL, SQL Server, SQLite, Oracle
NoSQL	Cassandra
Event streaming	Kafka
Cloud infrastructure	Kubernetes
Configuration management	Terraform, Ansible
Build systems	Github Actions, Jenkins
AI development tools	Claude Opus, Copilot
Containerization	Docker, buildpack

Professional Experience

June 2025 - June 2026: Empower

Senior Software Engineer

- Inherited an ANTLR4 based Java code validation/static code analyzer created to validate code from projects being

migrated from 1990's ProC code to Spring Boot 3 REST services

- Developed a maven plugin for this project that allowed developers to run it against their codebase and get a report detailing violations encountered
- Developed code based rule definition and execution engine that allowed for flexible rule implementations to parse Java code and detect violations
- Owned all aspects of said validation project from design to release
- Managed bug fixes, rule definition refinement, and fixing issues related to edge cases as they arose
- Optimized slow, serial Java file parsing by implementing multithreaded file parsing
- Dealt with code that wasn't thread safe, and refactored a ForkJoinPool implementation to use parallel streams instead
- Used Copilot + Claude Opus to navigate through various multithreading and testing issues
- Mentored a junior developer that contributed changes to the project

January 2022 - April 2025: HelioGenomics

Senior Software Engineer

- Built an SMS appointment reminder service that patients could sign up for and receive appointment reminders at configured intervals using an FSM to track state
- Built several services to integrate with various vendor APIs, including Chargebee and Kareo
- Built and deployed a payment batch processing system running on Fargate, Batch and EventBridge to handle scheduled ingestion patient billing information into Oracle NetSuite
- Built a simple fuzzing application for testing UI features using Playwright
- Integrated HL7 (HAPI) into a Spring Boot application
- Set up SSO and a VPN on AWS using Terraform
- Set up a small Spring Boot application to handle Office 365 authentication
- Built out test data generation service to allow users to populate Salesforce objects through Lockbox using REST
- Managed design, planning and implementation of all previously mentioned projects independently
- Handled constant context switching and pivoting with very little in the way of structure or agile/scrum planning

January 2021 - January 2022: Charter/Spectrum

Senior Software Engineer Contractor

- Built REST service to create generic, fast mock service request/response definitions for the QA team that allowed them to run test scenarios.
- Used dynamodb for storing configuration.
- Added REST client integrations to consume multiple internal APIs for various subscriber package entitlements
- Refactored existing calls that obtain subscriber entitlement codes to use new internal API endpoints and fall through gracefully based on response

June 2020 - December 2020: NASDAQ

Software Consultant

- Worked on a Spring Boot application that read trading data messages from a Kafka stream and wrote them out as parquet files to S3 and inserted records into a Glue catalogue
- Implemented a data transformation layer to handle various transformations on Avro messages

June 2019 - June 2020: TalentReef

Senior Software Engineer

- Brought up test coverage for several legacy Scala Play applications

- Wrote a small tool to migrate from our version of Kong API gateway to the newest version
- Worked on solving application issues related to memory leaks and long standing timezone problems
- Wrote an everify API proxy to handle applicant employment verification requests
- Wrote an Akka based user provisioning retry feature
- Advised on several tech decisions, including incorporating the usage of terraform for infrastructure changes, and using flywaydb for database migrations.
- Took charge of developing a new greenfield Java service to manage and orchestrate client data replication across environments.
- Handled the vast majority of design and implementation for the API contracts, code reviews, sustainable code development and design practices

September 2018 - June 2019: Charter/Spectrum

Senior Software Engineer

- Benchmarked Protocol Buffer serialization for Kafka interaction in Scala.
- Incorporated protocol buffers into the service owned by our team
- Worked on system to reconcile entitlements to customers using CQRS.
- Wrote an in-memory service to normalize customer data to make transmitting data over Protocol Buffers leaner.
- Implemented various REST endpoints and an HTTP client to handle discrepancies between services

April 2018 - September 2018: Enlitic

Senior Software Engineer

- Architected, planned and built out tooling to help data scientists manage deep learning modeling code snapshots
- Consulted and improved build and deploy processes for various applications
- Advised on AWS practices

October 2016 - April 2018: Ancestry.com

DNA Data Science Platform - Senior Software Engineer

- Set up a build system using Jenkins 2 Pipelines to deploy the application to EC2 instances running Docker on CoreOS
- Used Terraform to set up all required IAM roles, policies, and other resources
- Successfully launched beta version of orchestration application

DNA Platform - Senior Software Engineer

- Designed and implemented a Spring Boot application to manage provisioning EC2 instances for DNA scientists
- Set up a more robust build system for an existing application
- Mentored junior developers

August 2012 - October 2016: Ancestry.com

Devops - Software Developer

- Wrote several tools to handle several large image imports and mysql data migrations for an image service that handled several terabytes of image data
- Maintained large, legacy, high traffic image service written in Perl on AWS backed by MySQL and S3

April 2006 - August 2012: CodedRight

Independent Contractor/Founder

January 2012 - April 2012: Ionzero, LLC

Software Engineer

Education

2007-2010 Metropolitan State College of Denver Denver, CO

BS in Computer Security with a minor in Computer Science

2006-2007 University of Northern Colorado Greeley, CO

Open Source Work

- <http://github.com/dhoss>

Software I've written:

- [GiantDad](#) - A simple workout tracker written in Java using Micronaut and Postgres
- [Juke](#) - An attempt to rewrite the ancient phpnuke cms in Java using Spring Boot 3 and Postgres
- [Trayzn](#) - A simple bookmarking service written in Java using Spring Boot 3 and Postgres. Browser extension code is located here: [trayzn-chrome extension](#)
